Background

Century West Engineering (CWE) was selected by the City of Roseburg to develop the new 2021 Five-Year Pavement Maintenance Plan (PMP) as the previous five-year study was completed in 2016. The updated study will capture projects completed since the 2016 report, assess existing pavement conditions, and analyze various pavement improvement scenarios using current cost trends.

A more detailed breakdown of the process is as follows:

- **Perform pavement condition field assessment** – The assessment will encompass the City's entire paved street network. The resulting data will be uploaded into the City's pavement management analysis software, called StreetSaver.
- **Determine desired pavement treatment strategies** - Once rehabilitation and maintenance methods are determined, anticipated costs will be developed for the proposed improvement methods. This information will then be uploaded into StreetSaver for use as the basis of analysis for various funding scenarios.
- **Analyze Budget Scenarios** – StreetSaver uses treatment methods, cost information and field assessment data to provide analysis for various funding scenarios. The StreetSaver software's output provides project list(s) and cost information that serves as the foundation for evaluating the cost/benefit analysis in a variety of PMP scenarios.
- **Refine Preferred Scenario Project List** – The project list for the preferred scenario is refined to account for upcoming capital projects including franchise utility improvements and any other activities that may impact the viability and/or timing of proposed treatment methods for the selected roadway segments.
- **Develop Five-Year PMP Report** – including a working project list to guide PMP efforts.

Overview of the City of Roseburg Street Network

The City of Roseburg's transportation system includes roughly 112 miles of City-owned paved surface streets of varying size and capacity. These 112 miles of streets are an asset to the City worth approximately \$120M, which makes the street network the single largest asset the City owns. Funding for maintaining this asset has historically been made available through a variety of sources. These Sources include Surface Transportation Program funds, state gas tax, City transportation system development charges (SDC's) and franchise utility fees.

The following roadway classifications are used to define the role of different street segments within the City. The roadway classifications also provide an idea of the level of traffic these roadway segments experience. More information regarding the roadway segment definitions, along with definitions for many of the other terms found throughout this report, can be found in Appendix A.

- **Arterial Roadways** – includes Principal Arterial, Major Arterial, Minor Arterial

CITY OF ROSEBURG | FIVE YEAR PAVEMENT MAINTENANCE PLAN UPDATE

August 6, 2021

- Collector Roadways – includes Major Collector and Minor Collector.
- Local Roadways – includes all other roads under City jurisdiction that are not in the Arterial/Collector categories.

The following table illustrates centerline miles by functional classes. Individual roadway segment information can be found in Appendix B.

Table 1 Centerline Miles by Functional Class

Functional Class	Sections	Centerline Miles ¹	Lane Miles ²	% of the Entire Network (by Total Lane Miles)
Arterials	52	14.34	55.75	22%
Collectors	96	17.19	36.28	15%
Residential	741	80.70	158.11	63%
Total	889	112.23	250.15	100%

The following chart illustrates the various types of roadway pavements present. The Roadway Pavement Type definitions can be found in Appendix A.

Figure 1 Roadway Pavement Types

¹ Centerline miles refer to the total length of a roadway while ignoring the size/number of lanes.

² Lane miles represent total centerline miles of a roadway multiplied by the number of lanes.

Theory/Need behind developing a Pavement Maintenance Plan

Pavement Maintenance is a set of tools and philosophies designed to manage the maintenance activities of asphalt concrete and Portland concrete pavements. A Pavement Maintenance System consists of a software module to keep track of existing and historical pavement condition data combined with a decision-making process to help choose the most cost-effective maintenance strategies that determine what streets to treat and when. The purpose of this Pavement Maintenance Plan is to assist the City of Roseburg in utilizing the results of the StreetSaver program output to utilize Pavement Maintenance Program funds and to determine if those funds are adequate to meet the maintenance goals of the City.

The principal statistic that pavement managers use to evaluate their pavement is Pavement Condition Index (PCI). PCI is a measurement of the health or condition of the pavement network and ranges from 0 to 100. A newly constructed street would have a PCI of 100, while a failed street would have a PCI of 10 or less. The PCI is calculated based on pavement distresses identified in the field.

This report will generally break down the pavement maintenance activities into two treatment categories:

- **Preventative Maintenance (PM)** – refers to repairs (typically various types of sealers or surface treatments) applied while the pavement is in “very good” to “good” condition. These repairs extend the life of the pavement at relatively low costs and attempt to prevent the pavement from deteriorating into conditions requiring treatments that are more expensive. This analysis includes slurry seals, chip seals and crack sealing treatments as part of the PM toolbox. The costs for surface treatments are approximately \$1-\$3 per square yard per treatment.
- **Rehabilitation (Rehab)** – this refers to resurfacing, restoration, and rehabilitation work consisting of structural enhancements that extend the service life of an existing pavement and/or improve its structural capacity. These treatments are typically applied to roads in the “fair” to “poor” condition to reset the deterioration process to avoid complete reconstruction of the pavements. This study included varying depths of asphalt pavement overlays and grind/inlay treatments, with costs in the range of \$20-\$40 per square yard depending on depth and roadway classification.

An additional category that is mentioned, but not used as a pavement maintenance strategy, is **reconstruction**. Reconstruction involves completely rebuilding the pavement section and underlying aggregate section. This is generally reserved for “poor” to “very poor” pavements as it carries a very high price tag that typically ranges from \$80-\$150 per square yard depending on the pavement section.

Conventional wisdom of most public works and street department agencies has been to treat streets with a “worst-first” philosophy. Under this “worst-first” policy, streets are allowed to deteriorate to a nearly failed condition before any rehabilitation (such as overlays or

CITY OF ROSEBURG | FIVE YEAR PAVEMENT MAINTENANCE PLAN UPDATE

August 6, 2021

reconstructions), are applied. Some might refer to this as the “don’t fix if it isn’t broken” mentality.

The StreetSaver program was developed by the Metropolitan Transportation Commission and utilizes various ‘what-if’ analyses (scenarios) using a toolbox that provides type, costs, and lifespan for various treatments (decision tree) to determine the most effective means of providing maintenance and rehabilitation treatments to various pavement segments. The program is generally designed with a “best-first” approach that focuses on treating streets with lower-cost Preventative Maintenance treatments before the street conditions deteriorate to a point where costly rehabilitation or reconstruction is required. The graphic below provides a visual of the typical life cycle of pavements and associated costs. The decision tree can be found in Appendix C.

Figure 2 Condition Costs vs. Years

History of Roseburg PMP

The City of Roseburg (City) developed an initial 5-Year Pavement Maintenance Program Budget Options Report in 2010.

That report, like this report, included a projection of the PCI change over the 5-year period and the change in the City’s deferred maintenance. Deferred maintenance refers to the dollar amount of maintenance and rehabilitation work that should have been completed to maintain the street in the optimal PCI range, typically the “good” condition, but was deferred due to

CITY OF ROSEBURG | FIVE YEAR PAVEMENT MAINTENANCE PLAN UPDATE

August 6, 2021

funding deficiencies for preventative maintenance and/or pavement rehabilitation programs.

The 2010 report projected that the City's average PCI would increase by 2 points over 5 years (through 2015) based on the projected funding level, but the deferred maintenance would increase by \$1.7 million. The PCI did increase from 70 to 72 and the deferred maintenance increased from \$6.7 million to \$8.2 million during this time span.

A subsequent report was completed in 2016, with the projection that the City's average PCI would decrease from 72 to 69 and deferred maintenance would increase to \$10.6 million based on current funding. The PCI did decrease to 69 and was trending towards 68 prior to reassessment in 2020. The deferred maintenance increased to \$11 million.

The graph below shows the City's PCI and deferred maintenance over time.

Note that the significant jump to a PCI of 74 in 2020 is primarily a representation of recent modifications to the pavement condition field assessment methodology for PCI ratings of streets completed in 2020 and StreetSaver's tendency to underestimate the benefits of surface seal treatments. The PCI also benefitted from a handful of capital projects recently completed using Urban Renewal District (URD) funds.

Figure 3 PCI vs Deferred Maintenance

The primary drivers of the decreasing PCI and increasing backlog is the cost increase of

CITY OF ROSEBURG | FIVE YEAR PAVEMENT MAINTENANCE PLAN UPDATE

August 6, 2021

pavement maintenance relative to the City's budget that is allocated for pavement improvements. Another significant driver is the financial impact of meeting American with Disabilities act requirements for physical curb ramp barriers. These improvements are largely funded with Pavement Maintenance Program funds, which effectively decreases the funds available for "pavement" related improvements. Additional information regarding ADA considerations is provided below.

ADA Considerations

Title II of the ADA requires state and local governments to make their programs, services, and activities accessible to persons with disabilities through the establishment of physical access requirements for public facilities. A major component applicable to the street network is that of curb ramps. The City completed an ADA Transition Plan with the assistance of Century West Engineering (CWE) in 2018 and determined that the City had over 1,500 ramps to construct or reconstruct at that time to achieve ADA compliance. With these improvements estimated to occur over a 30-year period, this assumes roughly 50 ramps will be replaced annually. With curb ramps costs continuing to climb and currently averaging roughly \$10,000 per ramp, this represents a significant financial commitment. When ramp upgrades are required due to PMP-related projects, the costs for the ramp improvements are borne from the PMP annual funds. This substantially impacts the extent of pavement improvements that can be provided by the Pavement Maintenance Program.

CWE utilized GIS data from StreetSaver and GIS data for the City's curb ramp inventory to forecast curb ramp improvement needs as part of the PMP planning process.

Note that pavement rehabilitation treatments, when completed adjacent to an existing curb ramp or intersection corner, require the upgrade of that curb ramp if not in compliance with the ADA. Many pavement maintenance activities do not require the curb ramp to be upgraded at the time of the pavement treatment per the ADA.

Table 2 ADA Curb Ramp Retrofit Triggers

ADA Triggered	Maintenance/No ADA Triggered
Grind and Overlay	Chip Sealing
New Asphalt	Slurry Sealing
New Construction	Crack Sealing
Rehabilitation & Reconstruction	Pavement Patching

Pavement Maintenance Planning Process

Pavement condition field assessment

Century West Engineering (CWE) was selected by the City of Roseburg to update the

CITY OF ROSEBURG | FIVE YEAR PAVEMENT MAINTENANCE PLAN UPDATE

August 6, 2021

Pavement Maintenance Program using the StreetSaver software. The first step of this process was to better understand the current pavement condition of the street network. CWE collaborated with Capital Asset Pavement Management (CAPS) to perform pavement distress ratings, or pavement condition inspections, of the City-maintained streets in January 2020 following the Metropolitan Transportation Commission (MTC) pavement condition distress identification guidelines and using the driving inspection method. Pavement distress data was collected for all 112 miles of City-maintained roadways and entered into StreetSaver to calculate the section's PCI.

Roadway condition inspections did not address non-pavement issues such as traffic, safety, street hazards, geometric issues, drainage issues, or immediate maintenance needs.

The resulting network condition summary and breakdown of conditions per street segment when evaluated in 2020 is provided in Appendix B.

The assessment determined that the overall network PCI of the City's roadway network is 74, which indicates the network is in "good" condition. The table below provides additional detail regarding the street network by functional roadway classification and the resulting PCI.

Table 3 Functional Class Summary

Functional Class	Sections	Centerline Miles	Lane Miles	Average PCI
Arterials	52	14.34	55.75	83
Collectors	96	17.19	36.28	77
Residential	741	80.70	158.11	70
Total	889	112.23	250.15	74

Table 4 below provides additional information on the condition class ranges and how the various roadway classifications currently fit within these categories.

Table 4 Condition Class Summary

Condition Class	PCI Range	Arterial	Collector	Residential	Total
Very Good	70+	19%	13%	44%	76%
Good	50-70	3%	2%	10%	15%
Poor	25-50	0%	0%	7%	7%
Very Poor	0-25	0%	0%	2%	2%
Total		22%	15%	63%	100%

Figure 4 below illustrates the percentage of the overall street network area by condition class.

Figure 4 Pavement Condition Class Breakdown

Determine desired pavement treatment strategies

Upon completion of the data collection activities, Century West Engineering (CWE) reviewed and discussed maintenance and rehabilitation (M&R) strategies with the City staff. This included selecting appropriate and effective treatments such as various types of surface seals, overlays, grind/inlays, etc. and determining how these strategies are to be applied to the various roadway classifications.

Once the various treatment strategies had been determined, CWE developed appropriate unit costs by analyzing City construction bid tabulations over the past 3-5 years and evaluating trends within these construction costs. The unit costs that were developed represent the overall project cost, including material costs, traffic control, mobilization and all the other costs that would be included in the bidding of the construction project. The costs were determined for 2021 construction, with an annual inflation rate of 3%³ factored for future years of construction.

The treatment types and anticipated 2021 construction costs were built into the Decision Tree. An overview of the Decision Tree is shown below, with the full version located in Appendix C. The Decision Tree serves as the basis for how the algorithms within StreetSaver are applied to the database of street network information to evaluate the various budget scenarios.

³ An inflation rate of 3% is close to the long-term average annual inflation rate of the United States, but conservative for more recent decades that ranged from 1.8% to 2.5%.

CITY OF ROSEBURG | FIVE YEAR PAVEMENT MAINTENANCE PLAN UPDATE

August 6, 2021

Note that the City did not include slurry seals as a treatment option for arterial roadways within the Decision Tree. This may be reviewed on a case-by-case basis; however, past challenges with traffic control, citizen complaints and work zone compliance have made this maintenance strategy largely infeasible for arterial roadways.

Table 5 Decision Tree

Condition Category	PCI	Arterial		Collector		Residential	
		Treatment	Cost	Treatment	Cost	Treatment	Cost
I – Very Good – Crack (PCI>70)	>70	Seal Cracks	\$1.00 /linear foot	Seal Cracks	\$1.10 /linear foot	Seal Cracks	\$1.10 /linear foot
I – Very Good – Surface / Restoration	>70	Do Nothing	\$ -	Do Nothing	\$ -	Do Nothing	\$ -
II - Good, Non-Load Related	50-70	2" Grind and Inlay	\$27.60 /Square Yard	2" Grind and Inlay	\$27.60 /Square Yard	Slurry Seal/Chip Seal	\$3.00 /Square Yard
III - Good, Load Related	50-70	2-3" Grind and Inlay	\$30.80 /Square Yard	2-3" Grind and Inlay	\$30.80 /Square Yard	Slurry Seal w/ Localized Repairs	\$6.25 /Square Yard
IV - Poor	25-50	3-4" Grind and Inlay	\$37.10 /Square Yard	3-4" Grind and Inlay	\$37.10 /Square Yard	2" Overlay or Grind and Inlay	\$22.95 /Square Yard
V - Very Poor/Failed	<25	Reconstruct Structure or CTB w/ AC	\$82.00 /Square Yard	Reconstruct Structure or CTB w/ AC	\$82.00 /Square Yard	3-4" Grind and Inlay	\$33.40 /Square Yard

Engineering, construction support and general administrative costs were factored into the budget scenarios outside of StreetSaver. The City has traditionally relied on outside engineering and construction support to augment their staffing for pavement rehabilitation and curb ramp projects; therefore, the plan includes a 15% budget allocation for these overhead costs on the PMP projects. Pavement maintenance projects are historically designed and administered solely by City staff, so no budget allocation for engineering overhead costs is included for PM projects.

The construction costs for curb ramp improvements for ADA-compliance were also factored into the budget analysis outside of StreetSaver. Based on data from City bid tabulations and statewide data from other curb ramp improvement projects, the following costs were included in the budget scenario analysis:

Local Roads: \$8,200/ramp. Ramps on local roads typically see cost savings due to longer working hours, less stringent traffic control and less utility conflicts.

CITY OF ROSEBURG | FIVE YEAR PAVEMENT MAINTENANCE PLAN UPDATE

August 6, 2021

Arterials/Collectors: \$12,300/ramp. Ramps on these roads are typically subject to shorter working hours, more roadway closure restrictions, involved traffic control and more utility infrastructure.

Potential 'Unconstrained' Budget Needs

Based on the principle that it costs less to maintain streets in good condition than those in bad condition, the ideal PMP strives to develop a maintenance strategy that will improve the overall condition of the network to an optimal PCI, typically in the low to mid 80's, and then sustain the roadway at that level using lower cost preventative maintenance measures.

The fundamental basis of this approach is to drive the deferred maintenance down to zero as quickly as possible using an 'unconstrained' budget. Although the City of Roseburg's current PCI of 74 is in the 'good' category, the magnitude and variability of the roadway network at this PCI still equates to a backlog of approximately \$11 million. Factoring in the reconstruction of curb ramps, engineering, and administration costs, clearing this backlog would likely require an infusion of \$20 million or more in the 2021 plan year. Additionally, \$1.75M would be required annually in subsequent budget years to provide preventative maintenance measures to maintain this optimal PCI. City staff recognized that this plan is infeasible and there was no analysis provided to this end.

Analyzed Budget Scenarios

As the unconstrained budget scenario was not analyzed, the next step in developing a cost-effective pavement maintenance strategy is to conduct various 'scenarios. These scenarios are essentially what-if analyses that aim to determine the highest and best use of the annual scenario budget to achieve the maximum PCI. The program projects the effects of the different scenarios on pavement condition PCI and deferred maintenance (backlog). By examining the effects on these indicators, the advantages and disadvantages of different funding levels and maintenance strategies become clear.

The following scenarios were run for both 5-year and 10-year periods to determine the long-term effects of the variable PM scenarios. The project list development will focus on the upcoming 5-year period, however, a handful of 10-year results are also shown to better magnify the slight performance differences between variable PM scenarios.

A brief overview of the various scenarios is below. More detailed budget scenario reports can be found in Appendix D.

Variable PM Scenarios

Many agencies are struggling with near-term and potential long-term funding challenges due to reduced revenues from gas taxes resulting from several factors, such as a decline in vehicle use due to the recent COVID-19 pandemic and the growth of the electric vehicle segment.

As a result, the City felt it was most prudent to analyze multiple budget scenarios targeting the

CITY OF ROSEBURG | FIVE YEAR PAVEMENT MAINTENANCE PLAN UPDATE

August 6, 2021

current funding levels of \$1.325 million annually to determine if a different ratio of pavement rehabilitation (Rehab) vs preventative maintenance (PM) could achieve better results for the PCI. For reference, the City has historically been funding PM at approximately 10%-15% of the annual budget level in recent years.

The City currently spends approximately \$1.325M per year on average for pavement maintenance; however, this amount varies slightly from year to year. To standardize the comparison of the variable PM scenarios, an annual budget of \$1M for pavement-related costs was assumed, with the remainder of the overall budget stemming from curb ramp improvements, engineering, and administration. Using this approach, the resulting annual budgets varied slightly between the different scenarios, however, they generally averaged an annual budget of \$1.4M. This funding level saw the PCI drop from the current 74 to a range of 66-68 by year 2030, with backlog growing to anywhere from \$24.3M to \$27.7M depending on the scenario. Table 6 below provides a summary of the Variable PM Scenario results.

1. 0% PM - Current Budget using 100% Rehab and 0% PM
2. 10% PM - Current Budget using 90% Rehab and 10% PM*
3. 20% PM - Current Budget using 80% Rehab and 20% PM*
4. 30% PM - Current Budget using 70% Rehab and 30% PM*
5. Max PM - Current Budget using the maximum PM possible in every given plan year*

Table 6 Variable PM Scenarios

Scenario ⁴	0%PM	10%PM	20%PM	30%PM	Max PM
Avg. Annual Rehab Budget	\$998,721	\$906,136	\$873,830	\$868,353	\$871,629
Avg. Annual PM Budget	\$1,156	\$91,980	\$124,090	\$129,709	\$125,578
Current PCI	74	74	74	74	74
PCI 2025	72	72	72	72	72
PCI 2030	66	67	67	67	68

⁴ Note that these scenarios had varying amount per year of PM, with max percent per year noted in the scenario name. This is due to StreetSaver analysis determining that the cost to treat all streets qualifying for PM was less than the given budget for PM in some years.

CITY OF ROSEBURG | FIVE YEAR PAVEMENT MAINTENANCE PLAN UPDATE

August 6, 2021

Backlog 2025	\$17,098,020	\$16,518,639	\$15,727,145	\$15,723,338	\$15,729,896
Backlog 2030	\$27,745,393	\$25,654,758	\$24,285,991	\$24,680,417	\$24,844,953
Current % Very Good	72.1	72.1	72.1	72.1	72.1
2030 % Very Good	66.1	70.5	70.4	71	71
Avg. Annual Curb Ramp Quantity	25	22	22	22	22
Annual Curb Ramp Costs	\$273,470	\$233,290	\$232,880	\$232,880	\$231,240
Annual Eng./Adm in Costs (Rehab, Ramps Only)	\$190,700	\$169,700	\$154,800	\$139,700	\$119,100
Annual Subtotal	\$1,463,800	\$1,401,900	\$1,385,800	\$1,370,900	\$1,348,400

Maintain PCI (assuming 10% PM)

As the City recognized that the PCI has been decreasing year over year under the current budget model, a scenario to maintain the current PCI was also analyzed. This scenario aims to ensure the overall PCI of the pavement network does not drop below the current PCI of 74.

Multiple iterations were used to target an annual budget of \$2M earmarked for pavement-related costs. Like the Variable PM scenarios, the costs associated with engineering, administration and curb ramp construction were added on top of this amount. The resulting annual budget of \$2.816M would maintain the PCI at 74 and maintain the backlog with a slight increase from \$11.1M to \$11.7M by year 2030.

The table below provides an overview of the Maintain PCI scenario results. To provide additional context to the results of the Maintain PCI scenario, it is shown relative to the 10% PM scenario (using current budget) from Table 6 above.

CITY OF ROSEBURG | FIVE YEAR PAVEMENT MAINTENANCE PLAN UPDATE
August 6, 2021

Table 7 Maintain Current PCI Scenario

Scenario	10%PM*	Maintain Current PCI
Avg. Annual Rehab Budget	\$906,136	\$1,797,881
Avg. Annual PM Budget	\$91,980	\$200,638
Current PCI	74	74
PCI 2030	67	74
Backlog 2030	\$25,654,758	\$11,773,962
Current % Very Good	72.1	72.1
2030 % Very Good	70.5	89.3
Avg. Annual Curb Ramp Quantity	22	43
Annual Curb Ramp Costs	\$233,290	\$475,600
Annual Eng./Admin Costs (Rehab, Ramps Only)	\$169,700	\$341,000
Annual Subtotal	\$1,401,900	\$2,816,000

A comparison of the five scenarios (four Variable PM scenarios and the Maintain PCI scenario) relative to PCI change and deferred maintenance change over time is shown below:

Figure 5 Deferred Maintenance vs. Plan Year of Scenario

CITY OF ROSEBURG | FIVE YEAR PAVEMENT MAINTENANCE PLAN UPDATE

August 6, 2021

Figure 6 PCI vs. Plan Year of Scenario

A comparison of the five scenarios and the resulting percentage of the street network falling into the various condition categories is shown below:

CITY OF ROSEBURG | FIVE YEAR PAVEMENT MAINTENANCE PLAN UPDATE

August 6, 2021

Figure 7 Pavement Condition Category in 2030 of Scenario 1-6

Project List Development – Preferred Scenario

With the assumption that the current budget for pavement maintenance is not anticipated to significantly change soon, the City focused primarily on the comparison of the Variable PM scenarios when determining the preferred scenario.

After weighing several factors, the City chose the 20% PM as the preferred alternative.

Note that Street Saver tends to underestimate the effectiveness of surface treatments that the City would use for Very Good and Good Condition roads, especially when performed on roads under a PCI of 75. Having a street maintenance program that has a heavier focus on these treatments, therefore, should result in higher PCIs observed at the next pavement condition

CITY OF ROSEBURG | FIVE YEAR PAVEMENT MAINTENANCE PLAN UPDATE

August 6, 2021

assessment than those projected by the program. This was one of the driving factors in the City choosing a higher percentage preventative maintenance scenario.

The 20% PM scenario will represent an increase in annual preventative maintenance compared to the 10-15% annual preventative maintenance of recent years. The City wants to increase PM, but preferred the 20% PM over higher percentage PM scenarios as the 20% PM isn't a drastic departure from its current operations.

The 30%, 40% and Max PM preventative maintenance scenarios all had multiple years where there was no PM at all due to essentially running out of roadway inventory to apply the preventative maintenance to. This was a concern to the City for several reasons and further substantiated the 20% PM scenario.

Century West Engineering (CWE) and CAPS collaborated to further refine the 20% PM annual budget such that the average annual project cost (PM, Rehab, Ramps, Eng. /Admin) would fall in line with the anticipated \$1.325M budget.

Project List Refinement

StreetSaver tends to provide output that consists of numerous short segments of improvements. Oftentimes, these shorter segments can be slightly shifted within the plan to combine with other short segments and provide a more efficient construction process.

The raw project list from StreetSaver can be further refined based on:

- visual observations of the pavement maintenance and rehabilitation sections to verify the appropriate PCI rating
- determination of low priority roads; either due to low traffic volume, cul-de-sac, etc.)
- historical knowledge from City staff regarding ongoing needs and high priority roadways review of future City utility projects
- coordination with future transportation CIP projects
- coordination with future utility projects (public and franchise)

The City has reviewed the initial StreetSaver project list and adjusted based on upcoming water and storm drainage projects.

Century West Engineering (CWE) shared the refined project list with RUSA to identify any future sewer needs that overlap with the planned PMP segments.

CWE and the City performed a site visit of the Rehab project extents to compare these locations against the criteria listed above and further refine the proposed project list.

This project list can be found in Appendix E in spreadsheet form and in Appendix F in graphical form.

Recommendations

Pavement Maintenance Strategies

Scenario and Needs analyses assume that the City will follow a good pavement maintenance philosophy of prioritizing preventative maintenance over rehabilitation. Based on this philosophy, CWE and the City recommend the 20% PM budget scenario.

By setting the priority of ensuring that Very Good streets stay Very Good using a cost-effective slurry, chip seal, and crack seal program, the City will save money in the long run.

The use of thinner AC overlays and/or grind/inlays to rehabilitate streets on the lower end of Good condition should be the second priority, followed by thick overlays on Poor streets. Failed, or Very Poor, streets should be the lowest priority, as the reconstruction that would be required to rehabilitate them are very expensive, and the money is better used on more cost-effective treatments to maintain and rehabilitate better streets.

Pavement Maintenance Strategies

To continue monitoring the street network, understand the performance of the selected pavement maintenance strategies and make necessary adjustment to these strategies, it is recommended that all streets within the City's network receive a pavement condition assessment inspection at no longer than a 5-year interval.

Pavement Budget

This report shows that the City's street network will continue to decline at the current funding levels provided for street maintenance.

Strategies that could be used to generate increase funding for street maintenance or decrease the need for future street maintenance could include the following:

- Transportation Utility Fee – A monthly recurring fee dedicated to street maintenance and collected within the city limits from all residents and businesses. The fees could be based on trip generation, as determined by zoning classification and building size (for non-residential uses) and collected through the City's regular utility billing.
- Transportation Bond – many agencies throughout the state have had success with voters approving bond measures for street preservation, along with other transportation-related items such as bicycle and pedestrian improvements.
- Increase Funding for ADA improvements – The curb ramp upgrades associated with PMP-related projects reduce the funds spent on pavement maintenance and rehabilitation. The City's transient lodging tax currently funds several items, including ADA Transition Plan upgrades. Increasing the lodging tax rate and/or reallocating the amount of lodging tax funds directed to ADA improvements could alleviate the amount of PMP funds used for curb ramp related improvements.

CITY OF ROSEBURG | FIVE YEAR PAVEMENT MAINTENANCE PLAN UPDATE

August 6, 2021

- Gas Tax – the City receives gas tax revenues at the state level, however, there is no gas tax at the City level. There are several considerations, such as more fuel-efficient vehicles, increases in electric vehicle ownership, forecasted increases to work-from-home employees, decreased driving due to the gas tax and how the gas tax may disproportionately affect low-income households.
- City Standards/Specification Update – This option has no substantial direct cost for the City but could benefit the condition of City roadways in later years by requiring private and municipal projects to use a larger street pavement section. The increases outlined below will typically represent a marginal increase in the cost of the associated project.
 - o **Local Street Section** - the current minimum local street section is 3.5" thickness of asphalt concrete (AC) over 9" thickness of aggregate base.
 - CWE would recommend 4" of AC over 12" of aggregate base as a minimum.
 - o **Collector/Commercial Street Section** – the current minimum collector street section is 4" thickness of asphalt concrete (AC) over 12" thickness of aggregate base.
 - CWE would recommend 5" of AC over 16" of aggregate base as a minimum
 - o **Arterial Street Section** – there is no current City standard detail for the arterial street section.
 - CWE would recommend 6" of AC over 18" of aggregate base as a minimum
 - o **All new street sections** - Require geotechnical testing to determine the actual bearing capacity of the soil. Use this information, along with traffic quantity and type, to determine pavement and aggregate base thickness increases when minimum bearing capacities are not met.

Definitions

Definitions

Centerline Miles refer to the total length of a roadway from a start point to an end point while ignoring the size/number of lanes.

Chip Seal – A chip seal is a two-step process which includes first an application of asphalt emulsion and then a layer of crushed rock to an existing asphalt pavement surface. A chip seal gets its name from the “chips” or small crushed rock placed on the surface.

Condition Categories

‘Good’ Condition Category – Streets in ‘Good’ condition have no to little distresses found on them. These streets may have some minor surface weathering or light cracking, but can generally be maintained with cost-effective preventative maintenance treatments (surface seals and crack seals).

‘Fair’ Condition Category – Streets in ‘Fair’ condition show some form of distress caused by traffic load related activity or environmental distress that requires more than a life-extending treatment. The MTC Streetsaver program separates these into two condition categories for the purposes of the analysis. Category II – ‘non-load’ and Category III – ‘load-related’, based on whether a majority of the distresses found had load or environmental related causes

‘Poor’ Condition Category – Streets in ‘Poor’ condition are near the end of their service lives and often exhibit major forms of distress such as potholes, extensive alligator cracking, and/or pavement depressions.

‘Very Poor’ Condition Category – Streets in the ‘Very Poor’ condition category indicate that the street has failed. These pavements are at the end of their service lives and have major distresses, often indicating the failure of the sub base

Crack Sealing – a method in which hot sealant is applied to working cracks to prevent water intrusion

Deferred Maintenance refers to the dollar amount of maintenance and rehabilitation work that should have been completed to maintain the street in “good” condition, but had to be deferred due to funding deficiencies for preventative maintenance and/or pavement rehabilitation programs. The actual repairs that are being deferred are often referred to as a “backlog.”

Grind/inlay and Overlay Treatments – This process is more intensive than chip or crack sealing; it involves grinding a layer of the pavement down, removing the grinded out asphalt, and then pouring a brand new layer of asphalt pavement down and restoring the structural strength of the roadway.

Lane Miles are calculated by taking the total centerline miles of a roadway and multiplying by the number of lanes.

Load related distress – Load related distresses, such as alligator cracking, rutting, and

depressions are usually a sign of a sub-base issue, caused by repeated traffic loads.

Local Streets: Local streets are intended to serve the adjacent land without carrying through traffic. These streets are designed to carry less than 1,200 vehicles per day. To maintain low volumes, local residential streets should be designed to encourage low-speed travel. Narrower streets generally improve the neighborhood aesthetics, and discourage speeding as well. They also reduce ROW needs, construction cost, stormwater runoff, and vegetation clearance. If the forecast volume exceeds 1,200 vehicles per day, as determined in the design stage, the street system configuration should either be changed to reduce the volume through neighborhood traffic-calming design features, or the street should be designed as a collector route.

Cul-de-sac streets are a type of Local Street. They are intended to serve only the adjacent land in residential neighborhoods. These streets are short, serving a maximum of 20 single-family houses. Because the streets are short and the traffic volumes relatively low, the street width can be narrow, allowing for the passage of two lanes of traffic when no vehicles are parked at the curb or one lane of traffic when vehicles are parked at the curb. To encourage the circulation capability of Local streets, the use of cul-de-sac streets is discouraged and should not be permitted if future connections to other streets are likely. New cul-de-sac streets should provide sidewalk connections to other nearby streets and sidewalks.

Major and Minor Collectors: Major Collector streets are primarily intended to serve abutting lands and the local access needs of neighborhoods. They serve either residential, commercial, industrial, or mixed land uses.

Minor Collector streets serve mostly residential or mixed land uses. Although through traffic connectivity is not a typical function of Minor Collector streets, they may carry limited amounts.

Network is defined as a complete inventory of all streets and other pavement facilities in which the City has jurisdiction and maintenance responsibilities. To facilitate the management of streets, they are subdivided into management sections identified as a segment of street, which has the same characteristics.

Non-load related distress – Non-load (or environmental), distresses typically have environmental causes related to the pavement becoming older and less elastic (brittle). Typical non-load distresses are longitudinal or transverse cracking, block cracking, and surface weathering and raveling.

Pavement Condition Index, or PCI, is a measurement of the health of the pavement network or condition and ranges from 0 to 100. A newly constructed street would have a PCI of 100, while a failed street would have a PCI of 10 or less. The PCI is calculated based on pavement distresses identified in the field.

Preservation is a process by which some type of sealer or surface treatment, other than an asphalt overlay, is placed over the existing pavement. Currently Public Works uses a process called slurry seal.

Preventive Maintenance refers to repairs applied while the pavement is in “good” condition. Such repairs extend the life of the pavement at relatively low costs, and prevent the pavement from deteriorating into conditions requiring more expensive treatments. Preventive maintenance treatments include slurry seals, crack sealing, and deep patching. Treatments of this sort are applied before pavement deterioration has become severe and usually cost less than \$3.00/sq.yd.

Principal and Minor Arterials: Principal arterial streets form the primary roadway network within and through a region. They provide a continuous roadway system that distributes traffic between different neighborhoods and districts. They provide limited access to abutting land, and have a greater focus on mobility and through traffic movement. Principal arterial streets carry the highest volumes on the network and typically maintain higher posted speeds. Inside UGBs, speeds may be reduced to reflect the roadside environment and surrounding land uses.

Minor arterials provide service for trips of moderate length and serve geographic areas that are smaller than their higher-volume principal arterial counterparts. Minor arterials are intended to be two- or three-lane streets.

Reconstruction is a process by which a street is completely rebuilt. The existing asphalt pavement and base is removed and replaced with new asphalt and base. Stewart Parkway is an example of street reconstruction.

Rehabilitation is a process intended to extend the life of existing pavement structures either by restoring existing structural capacity through the elimination of age-related, environmental cracking of embrittled pavement surface or by increasing pavement thickness to strengthen existing pavement sections to accommodate existing or projected traffic loading conditions. Winchester Street is an example of recent pavement rehabilitation.

Roadway Pavement Surface Types – the definitions below correlate to the predominant roadway pavement types found throughout the City, which are identified in Figure 1 Roadway Pavement Types:

A - AC is an Asphalt Concrete Pavement street that has one year’s asphalt, for example a street that has been newly constructed or reconstructed.

O – AC/AC is a street that has a preventative maintenance treatment, typically a slurry seal, that covers the original asphalt construction.

ST – these streets do not have an asphalt concrete layer, only a surface composed of layers of oil and/or rock (macadam/gravel and/or chip seal).

Portland Concrete Cement (**PCC**) streets have a surface layer of concrete, which is a mix of Portland cement, coarse aggregate, and sand.

Slurry Seal – A slurry seal is a mixture of aggregate, emulsion and mineral fillers which is mixed cold and placed by the same machine. The slurry is designed to seal pavements, restore uniform texture and color and provide good skid resistance.

Stop Gap refers to the dollar amount of repairs applied to maintain the pavement in a serviceable condition (e.g. pothole patching). These repairs are a temporary measure to stop resident complaints, and do not extend the pavement life. Stopgap repairs are directly proportional to the amount of deferred maintenance.
